

gradient descent. Note that, while gradient descent can be susceptible to local minima in general, the optimization problem we have posed here for linear regression has only one global, and no other local, optima; thus gradient descent always converges (assuming the learning rate $\hat{\epsilon}$ is not too large) to the global minimum.

Shwartz et al. (2007) demonstrate that the plain Stochastic Gradient Descent yields particularly effective algorithms when the input patterns are very sparse, taking less than $O(d)$ space and time per iteration to optimize a system with d parameters.
